## RM version 02.00.00.06

### Overview

This document provides the release information for the latest Resource Manager (RM) which can be used by applications that want to manage device resources.

RM includes:

- Pre-compiled library for DSP (Big and Little) Endian of RM.
- Source code.
- API reference guide

### Dependencies

RM is dependent on following external components delivered in PDK package:

- None

### New/Updated Features and Quality

This is an **engineering release**, tested by the development team.

#### **Release 2.0.0.6**

- See Table 1 for resolved IRs

#### **Release 2.0.0.5**

- Add Global resource list and Policy to support Qmss\_QueueType\_INTC\_SET[234]\_QUEUE to add all INTC(CIC) accessible queues.
- Service responses now contain the number of times the requesting instance has allocated the resource.
- Update policies and global resource lists to latest linux DTS.
- See Table 1 for resolved IRs

#### **Release 2.0.0.4**

- Added example that has Client running on DSP that communicates with a Server running in Linux user-space. Communication between ARM and DSP is over IPC MessageQ. Instructions for running the test application can be found in the RM User Guide:

[http://processors.wiki.ti.com/index.php/MCSDK\\_UG\\_Chapter\\_Developing\\_System\\_Mgmt#Running\\_RM\\_Test\\_Projects](http://processors.wiki.ti.com/index.php/MCSDK_UG_Chapter_Developing_System_Mgmt#Running_RM_Test_Projects)

- See Table 1 for resolved IRs

**Release 2.0.0.3**

- Added high priority accumulation and starvation counter queues to QM2.
- Extensive bug fixes and cleanup of RM source and test code
- Added ability to request a resource’s reference count
- Added ability for Client Delegates to locally manage resources
- Added Server process for Linux
- Added Linux process to process test project that exchanges messages between a Client process and the latter Server process
- See list of Resolved IRs

**Release 2.0.0.2**

- Added Shared Server and Shared Client instance types that use shared memory to communicate internally. No transport code is needed for these instance types to communicate. Intended for use in DSP only, time-critical applications where, non-blocking APIs are required.
  - Includes example showing how to setup and use Shared Server/Client
- Added RM instance cleanup APIs
- Extensive bug fixes and cleanup of RM source

**Release 2.0.0.1**

- Initial release

**Resolved Incident Reports (IR)**

Table 1 provides information on IR resolutions incorporated into this release.

**Table 1 Resolved IRs for this Release**

IR Parent/ Child Number	Severity Level	IR Description
SDOCM00102876	S3 - Minor	RM ARM to ARM client gets a segmentation fault when run

## Known Issues/Limitations

IR Parent/ Child Number	Severity Level	IR Description
SDOCM00100761	S3 - Minor	Integrate RM with BIOS and IPC components
SDOCM00100762	S3 - Minor	RM must be able to return a resource's list of owners if queried
SDOCM00100797	S2 - Major	Complete Testing of Local Resource Allocation from Client Delegate Feature
SDOCM00101294	S3 - Minor	rm: "linux-dtb-alias" needs to be able to read /proc/device-tree

## Licensing

Please refer to the SDK licensing document for the details.

## Delivery Package

There is no separate delivery package. RM is being delivered as part of PDK.

## Installation Instructions

RM is currently bundled as part of Platform Development Kit (PDK). Refer installation instruction to the release notes provided for PDK.

## Directory structure

The following is the directory structure after the RM package has been installed:

The following table explains each individual directory:

Directory Name	Description
ti/drv/rm	<p>The top level directory contains the following:-</p> <ol style="list-style-type: none"> <li><u>Environment configuration batch file</u> The file "setupenv.bat" is used to configure the build environment for RM.</li> <li><u>XDC Build and Package files</u></li> </ol>

	<p>These files (<code>config.bld</code>, <code>package.xdc</code> etc) are the XDC build files which are used to create the RM package.</p> <p>3. <u>Exported Driver header files</u> Header files which are provided by RM and should be used by the application developers for customization and usage.</p>
<code>ti/drv/rm/build</code>	The directory contains internal XDC build related files which are used to create the RM package.
<code>ti/drv/rm/device</code>	The directory contains the device specific RM global resource list and policy files.
<code>ti/drv/rm/docs</code>	The directory contains the RM documentation.
<code>ti/drv/rm/include</code>	The “include” directory has private RM header files. These files should not be used by application developers.
<code>ti/drv/rm/lib</code>	The “lib” folder has pre-built Big and Little Endian libraries for RM along with their <u>code/data size information</u> .
<code>ti/drv/rm/package</code>	Internal RM package files.
<code>ti/drv/rm/src</code>	Source code for the RM.
<code>ti/drv/rm/test</code>	The “test” directory in RM has unit test cases which are used by the development team to test RM.
<code>ti/drv/rm/util</code>	The “util” directory has BSD-licensed, open source components used by RM.

## Customer Documentation List

Table 2 lists the documents that are accessible through the `/docs` folder on the product installation CD or in the delivery package.

**Table 2 Product Documentation included with this Release**

Document #	Document Title	File Name
1	API documentation (generated by Doxygen)	docs/rmDocs.chm
